CONNECTING COMMUNITY. FINDING HOME.

C4 Team C3 | C4 3.0 Summer 2026

JUNE | 2026

Created with Nano Banana: gemini, 2026

The Problem

- Homelessness response focuses on survival, never on community integration
- Frontline organizations operate in silos with no shared infrastructure
- Community stigma prevents meaningful engagement

WHAT WE BUILT

1. Community Event Framework

- Reusable guideline document for any organizer to host awareness events
- Our event (June 18): youth awareness session, 3D printing workshop, face painting, structured feedback collection
- Partners deliver the messaging to share real stories and work to end the stigma.
- Feedback collected through structured anonymized surveys designed with different questions for different populations (community members vs people experiencing homelessness)

2. YouBelong Digital Platform

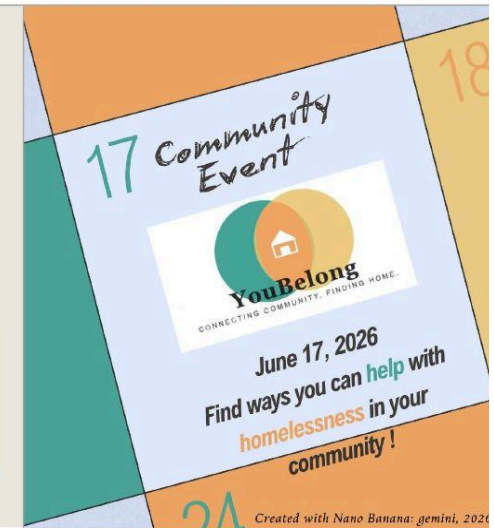

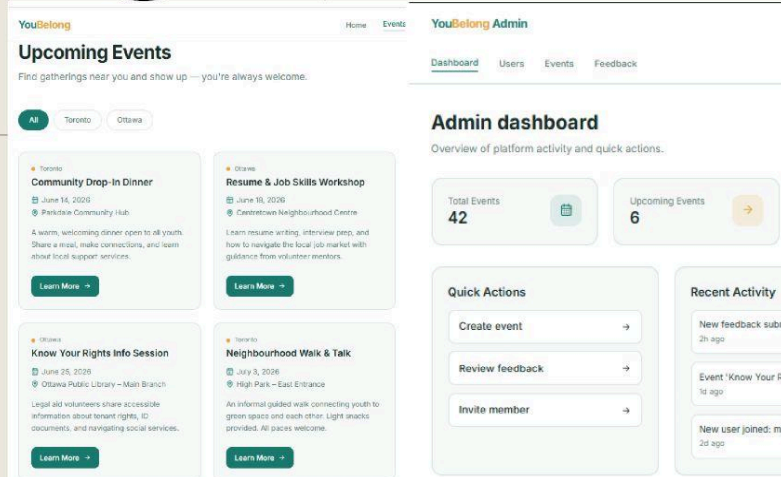

- Built with React (Vite), deployed on Vercel
- Community side: event discovery, resource access, feedback submission
- Organizer side: admin panel with role based permissions, event management, feedback review with ability to mark items as resolved
- 7 partner organization demo accounts configured
- Role based authentication routing users to correct portal
- Screenshot of the actual platform here

HOW THEY CONNECT

- Event captures relationships and collects feedback
- Platform stores feedback, connects organizations, and helps organizers improve the next event
- Each event feeds data into the platform. Each round of data improves the next event. The loop is continuous.

"Feedback is very important, especially when you're trying to build a movement." (HICC)

"People need actual relationships with the people around them. That's where change starts." (Better Street)

FUTURE DIRECTIONS

- Power BI integration to give partners a live analytics dashboard on feedback trends, sentiment shifts, and engagement patterns over time
- Onboarding all community events across neighbourhoods onto the platform so organizers have a centralized registry, not scattered outreach
- Doing the event at scale in several communities to gather real feedback to use for iteration and continuation
- Building out the feedback loop: each event generates data, data informs the next event's messaging and structure, creating a self improving system
